## General Advice:

- These instructions are intended as a guide only, if you are in any doubt you should seek the advice of a qualified professional.
- Take care not to mark finished parts with screwdrivers or other tools.
- Use a pair of rubber gloves to get a better grip on decorative hand tight parts.
- Ensure all parts are reassembled tightly.
- After maintenance test that all assemblies are water tight and function correctly.
- Always isolate the hot and cold water supplies before starting any maintenance, once isolated you should drain any residual water from your system.

## To replace the hot valve:

1. Loosen grub screw (D3) on the underside of handle (D4) using a 2mm A/F Allen key.
2. Pull the handle (D4) horizontally away from the tap. Note: a plastic spacer may come out with the handle, if so replace when reassembling.
3. Unscrew the valve cover (D2) by hand, if necessary use a pair of rubber gloves to get a better grip.
4. Hold the body of the tap (B1) firmly. Using an adjustable or 17mm ring spanner unscrew the valve (D1).
5. Clean the Inside of chamber (B3) with a soft wet cloth.
6. Reassemble the tap in the reverse order.
